(54) Title: HIGH REACTIVITY AND HIGH STRENGTH COKE FOR BLAST FURNACE AND METHOD FOR PRODUCING THE SAME

(54) 発明の名称: 高炉用高反応性高強度コークスおよびその製造方法

- 1...PERCENTAGE OF REACTION WITH, CO. CRI (%) 2...STRENGTH AFTER REACTION WITH, CO. CSR (%) A...CONVENTIONAL
- B...PRESENT INVENTION

pore diameter distribution can be produced at a low cost.

(57) Abstract: A high reactivity and high strength coke for a blast furnace which is produced by carbonizing a coal blend which contains 60 wt % or more of a medium caking coal of medium degree of coalification and low flowability containing 30 vol % or more in total of inert components, or a coal blend which contains 60 to 95 wt % of a medium caking coal of medium degree of coalification and low flowability exhibiting an average reflectance (Ro) of 0.9 to 1.1 and a maximum flowability (MF) of 3.0 or less and the balance amount of a caking coal exhibiting an average reflectance (Ro) more than 1.1, characterized in that it has a pore diameter distribution wherein the content of pores having a diameter less than 10 µm is 12 to 15 vol % and the content of pores having a diameter of 10 to 100 µm is 10 to 15 vol %. By using a coal blend of a small number of brand coals containing a large amount of caking coal having medium degree of coalification and low flowability, a high reactivity and high strength coke having a desired level of strength of coke, reactivity with CO2 or
